ON GRAPH INVARINTS OF OXIDE NETWORK

MUHAMMAD IMRAN, ASIMA ASGHAR, ABDUL QUDAIR BAIG

ABSTRACT. The application of graph theory in chemical and molecular structure research far exceeds people's expectations, and it has recently grown exponentially. In the molecular graph, atoms are represented by vertices and bonded by edges. In this report, we study the several Zagreb polynomials and Redefined Zagreb indices of Oxide Network.

Index Terms: Zagreb index; Randić index; polynomial; degree; graph.

1. Introduction

Many studies have shown that there is a strong intrinsic link between the chemical properties of chemical compounds and drugs (such as boiling point and melting point) and their molecular structure. The topological index defined on the structure of these chemical molecules can help researchers better understand the physical characteristics, chemical reactivity and biological activity. Therefore, the study of topological indices of chemical substances and chemical structures of drugs can make up for the lack of chemical experiments and provide theoretical basis for the preparation of drugs and chemical substances. In the past two decades, a large number of graph invariants (topological indices) have been defined and used for correlation analysis in theoretical chemistry, pharmacology, toxicology and environmental chemistry.

The first and second Zagreb indices are one of the oldest and most well-known topological indices defined by Gutman in 1972 and are given different names in the literature, such as the Zagreb group index, Sag. Loeb group parameters and
the most common Zagreb index. The Zagreb index is one of the first indices introduced and has been used to study molecular complexity, chirality, ZE isomers and heterogeneous systems. The Zagreb index shows the potential applicability of deriving multiple linear regression models. The first and the second Zagreb indices [1] are defined as

\[ M_1(G) = \prod_{u \in E(G)} (d_u + d_v), \]
\[ M_2(G) = \prod_{uv \in E(G)} d_u \times d_v, \]

For details see [2]. Considering the Zagreb indices, Fath-Tabar ([3]) defined first and the second Zagreb polynomials as

\[ M_1(G, x) = \sum_{uv \in E(G)} x^{d_u + d_v}, \]
\[ M_2(G, x) = \sum_{uv \in E(G)} x^{d_u \cdot d_v}. \]

The properties of \( M_1(G, x) \) and \( M_1(G, x) \) for some chemical structures have been studied in the literature [4, 5]. After that, in [6], the authors defined the third Zagreb index

\[ M_3(G) = \sum_{uv \in E(G)} (d_u - d_v), \]

and the polynomial

\[ M_3(G, x) = \sum_{uv \in E(G)} x^{d_u - d_v}. \]

In the year 2016, [7] following Zagreb type polynomials were defined

\[ M_4(G, x) = \sum_{uv \in E(G)} x^{d_u(d_u + d_v)}, \]
\[ M_5(G, x) = \sum_{uv \in E(G)} x^{d_v(d_u + d_v)}, \]
\[ M_{a,b}(G, x) = \sum_{uv \in E(G)} x^{ad_u + bd_v}, \]
\[ M_{a,b}^\prime(G, x) = \sum_{uv \in E(G)} x^{(d_u + a)(d_v + b)}. \]

Ranjin et al. [8] redefined the Zagreb indices, i.e, the redefined first, second and third Zagreb indices of graph \( G \). These indicators appear as

\[ RZ G_1(G) = \sum_{uv \in E(G)} \frac{d_u + d_v}{d_u d_v}, \]
On graph invariants of Oxide network

\[
ReZG_2(G) = \sum_{uv \in E(G)} \frac{d_u d_v}{d_u + d_v},
\]

and

\[
ReZG_3(G) = \sum_{uv \in E(G)} (d_u + d_v)(d_u d_v).
\]

For details about topological indices and its applications we refer \[9, 10, 11, 12, 13, 14, 15, 16, 17\]. In this paper we aim to compute Zagreb polynomials and redefined Zagreb indices of Oxide networks shown in Figure 1.

2. Main Results

In this section we give our main computational results.

![Oxide Network](image)

Figure 1. Oxide network.

In this section, we present our computational results.

**Theorem 2.1.** Let \( OX_n \) be the Oxide network. Then

1. \( M_3(OX_n, x) = 12nx^2 + (18n^2 - 12)x \)
2. \( M_4(OX_n, x) = 12nx^2 + (18n^2 - 12)x^3 \)
3. \( M_5(OX_n, x) = 12nx^2 + (18n^2 - 12)x^4 \)
4. \( M_{a,b}(OX_n, x) = 12nx^{2a+4b} + (18n^2 - 12)x^{4(a+b)} \)
5. \( M'_{a,b}(OX_n, x) = 12nx^{(2+a)(4+b)} + (18n^2 - 12)x^{(4+a)(4+b)} \)

**Proof.** Let \( OX_n \) be the oxide network. It is clear that \( OX_n \) has two partitions of vertex set i.e, \( V_1 = \{ v \in V(OX_n) : d_v = 2 \} \) and \( V_2 = \{ v \in V(OX_n) : d_v = 4 \} \). The edge set of \( OX_n \) has following two partitions,

\[
E_1 = E_{2,4} = \{ e = uv \in E(OX_n) : d_u = 2, d_v = 4 \},
\]

\[
E_1 = E_{4,4} = \{ e = uv \in E(OX_n) : d_u = 4, d_v = 4 \}.
\]

Such that

\[
| E_1(OX_n) | = 12n,
\]

\[
| E_2(OX_n) | = 18n^2 - 12n.
\]
\[ M_3(OX_n, x) = \sum_{uv \in E(G)} x^{d_u - d_v} = \sum_{uv \in E_2(OX_n)} x^{4 - 4} + \sum_{uv \in E_1(OX_n)} x^{4 - 2} = |E_2(OX_n)| x^2 + |E_2(OX_n)| = 12n x^2 + (18n^2 - 12n). \]

\[ M_4(OX_n, x) = \sum_{uv \in E(OX_n)} x^{d_u(d_u + d_v)} = \sum_{uv \in E_1(OX_n)} x^{4(2 + 4)} + \sum_{uv \in E_2(OX_n)} x^{4(4 + 4)} = |E_2(OX_n)| x^{12} + |E_2(OX_n)| x^{32} = 12n x^{12} + (18n^2 - 12n) x^{32}. \]

\[ M_5(OX_n, x) = \sum_{uv \in E(OX_n)} x^{d_u(d_u + d_v)} = \sum_{uv \in E_1(OX_n)} x^{4(2 + 4)} + \sum_{uv \in E_2(OX_n)} x^{4(4 + 4)} = |E_2(OX_n)| x^{24} + |E_2(OX_n)| x^{32} = 12n x^{24} + (18n^2 - 12n) x^{32}. \]

\[ M_{a,b}(OX_n, x) = \sum_{uv \in E(OX_n)} x^{a d_u + b d_v} = \sum_{uv \in E_1(OX_n)} x^{2a + 4b} + \sum_{uv \in E_2(OX_n)} x^{2a + 4b} = |E_2(OX_n)| x^{2a + 4b} + |E_2(OX_n)| x^{2a + 4b} = 12n x^{(2a + 4b)} + (18n^2 - 12n) x^{4(a+b)}. \]

\[ M_{a,b}')(OX_n, x) = \sum_{uv \in E(OX_n)} x^{(d_u + a)(d_v + b)} = \sum_{uv \in E_1(OX_n)} x^{(2 + a)(4 + b)} + \sum_{uv \in E_2(OX_n)} x^{(4 + a)(4 + b)} = |E_2(OX_n)| x^{(2 + a)(4 + b)} + |E_2(OX_n)| x^{(4 + a)(4 + b)}. \]
On graph invariants of Oxide network

\[ = 12nx^{(2+a)(4+b)} + (18n^2 - 12n)x^{(4+a)(4+b)}. \]

\[ \square \]

**Theorem 2.2.** Let \( OX_n \) be the Oxide network. Then,

1. \( \text{Re}ZG_1(OX_n) = 9n^2 + 3n \),
2. \( \text{Re}ZG_2(OX_n) = 36n^2 - 8n \),
3. \( \text{Re}ZG_3(OX_n) = 2304n^2 - 960n \).

**Proof.**

(1) \[
\text{Re}ZG_1(OX_n) = \sum_{uv \in E(OX_n)} \frac{d_u + d_v}{d_ud_v} \\
= \frac{3}{4}(12n) + \frac{1}{2}(18n^2 - 12n) \\
= 9n^2 - 3n.
\]

(2) \[
\text{Re}ZG_2(OX_n) = \sum_{uv \in E(OX_n)} d_u d_v \\
= \frac{4}{3}(12n) + 2(18n^2 - 12n) \\
= 36n^2 - 8n.
\]

(3) \[
\text{Re}ZG_3(OX_n) = \sum_{uv \in E(OX_n)} (d_u + d_v)(d_u d_v) \\
= 48(12n) + 128(18n^2 - 12n) \\
= 2304n^2 - 960n. \\
\square
\]
