Abstract: In this paper, the approach to obtaining nontrivial formulas for some recursively defined sequences is illustrated. The most interesting result in the paper is the formula for the solution of quadratic map-like recurrence. Also, some formulas for the solutions of linear difference equations with variable coefficients are obtained. At the end of the paper, some integer sequences associated with a quadratic map are considered.

Keywords: The Hadamard product, recursively defined sequence, difference equation, quadratic map.

MSC: 39A10, 05A15.

1. Introduction

Let us begin with some notation. Let \( b \) be a row vector and \( a \) be a finite row vector; \((b)_j\) denotes \( j \)th element of vector \( b \), \( |b| \) denotes length of \( b \); \( a ⌣ b \) def \( (a), \ldots, (a) = a, (b), \ldots, (b) = (b) = \prod_{m=1}^{d} m \), \( |b| = \sum_{j=1}^{d} (|b|)_j x^{j-1} \), \( 1_m = \prod_{j=1}^{m}(1) \), \( 0_m = \prod_{j=1}^{m}(0) \), \( [l,m] = 1_\infty \times (0 \ldots 0) \), where \( \times \) denotes the Kronecker product, \( l \in \mathbb{N}, m \in \mathbb{N} \cup \{\infty\} \). Note that the last function can be expressed by the ceiling function: \( [l,m] = \lceil(l + m) \rceil - \lfloor(l + m) \rfloor \).

Also, we use ordinary notation to denote the corresponding entrywise operations. For example, \( a^2 \) expresses the Hadamard square: \( a^2 = (a_j)^2 \).

It should be noted that there are many papers on sequences generated by linear difference equations with variable coefficients. See, for example, [1], [2], [3]. The simple approach illustrated here involves constructing for each such sequence a corresponding recursive vector sequence, which can be explicitly expressed using the following property of Hadamard product: \((ac) \ast (bd) = (a \ast c)(b \ast d)\), where \(|c| = |a|, |d| = |b|\) and \(* \in \{+, \times\}\).

2. Linear recurrences

First we use this property with respect to concatenation.

Theorem 1. If \( x_1, x_2 \) are arbitrary numbers, \( a_n, b_n \) are arbitrary number sequences and \( x_n = a_n x_{n-1} + b_n x_{n-2} \) for \( n \geq 3 \), then

\[
x_n = \sum_{j=1}^{f_n} ((x_1 - x_2)(\mathbf{f})_j + x_2) \left( \prod_{3 \leq k \leq n} b_k \right) \left( \prod_{3 \leq k \leq n} a_k \right),
\]

where \( f_n \) is nth Fibonacci number, \( \mathbf{f} = (0, 1, 0, 1, 0, \ldots) \) is infinite Fibonacci word, \( \mathbf{f}_k \) is obtained from \( \mathbf{f} \) by replacing each entry of zero with \( f_{k-1} \) zeros and each entry of one with \( f_{k-2} \) ones.

Proof. Define vectors: \( x_1 = (x_1), x_2 = (x_2), x_n = (b_n x_{n-1}) \ast (a_n x_{n-2}) \) for \( n \geq 3 \) and \( y_1 = x_1, y_n = y_{n-1} \ast x_n, p_n = 1_{f_n+1-1} \ast (b_n 1_{f_n+1} \ast (a_n 1_{f_n-1}) \) for \( n \geq 2 \).

Let \( \Lambda \subseteq b \). We have \( y_n = p_n \Lambda f_{n-1} y_{n-1} \) for \( n \geq 3 \), from which it follows that \( y_n = y_2, \prod_{k=3}^{n} p_k, \) etc.
Partition $y_{2,n} = y_1' \cdots y_n'$ such that $|y_i'| = f_i$, then $y_1' = x_1$, $y_2' = x_2$, $y_n' = y_{n-2} + y_{n-1}'$ for $n \geq 3$. Similarly partition $p_{k,n} = p_{k,1}' \cdots p_{k,n}'$ such that $|p_{k,i}'| = f_i$, then $p_{k,1}' = 1$, $p_{k,i}' = 1$ for $1 \leq i \leq k - 1$, $p_{k,n}' = (b_1 f_{k-1}) (a_1 f_{k-2}) \cdots (a_i f_{k-1})$, $p_{k,j}' = p_{k,j-2} \cdots p_{k,1}'$ for $k + 1 \leq i \leq n$.

Note that $(x_n) = (y_n') - \prod_{j=3}^{n} (p_{j,n}')$, where by $(a)_-$ we denote the vector composed of elements of $a$ in reverse order. Now $(y_{n})_-$ and $(p_{k,n})_-$ can be expressed in terms of infinite generalized Fibonacci words: $(y_n') = (x_1 - x_2)(f_1') + x_2 f_1 (p_{k,n}') = (f_{k+1} + b_k f_k + a_k (f_{n-1} - f_{k+1}) f_{k})^1$.

Finally using $x_n = |(x_n)_{-}|$ we get the result.

\[\blacksquare\]

**Remark 1.** It is easy to check that the result of Theorem 1 can be reformulated as follows:

The same sequence can be expressed with help of the Kronecker product.

**Theorem 2.** If $x_1, x_2$ are arbitrary numbers, $a_n, b_n$ are arbitrary number sequences and $x_n = a_n x_{n-1} + b_n x_{n-2}$ for $n \geq 3$, then

$$x_n = \sum_{2^{n-2}+1 \leq j < 2^{n-1}} (|x_2 - x_1|[1, 1, j] + x_1) \prod_{0 \leq k \leq n-3} a_{k+3} \prod_{0 \leq k \leq n-3} b_{k+3,n}$$

where $\theta(n) = \prod_{j=0}^{n-1} (1 - [3 \cdot 2^j, 2^j])$.

**Proof.** Define vectors: $x_1 = (x_1, x_2)$, $x_n = (12 x_{n-1})(b_n \times 1_{2^n-2})$ for $n \geq 2$, where $b_n = (0, 1, b_{n+1}, a_{n+1})$. It can be easily shown that $|x_n|_{2^n-1}^{|1|} = x_{n+1}$. Solving the recurrence equation we get: $r_n = (1_{2^n-1} \times x_1) \prod_{j=2}^n (1_{2^{j-1}} \times h_k \times 1_{2^{j-2}})$. Taking into account that $h_k = (0, 1, 1, 1) (b_{k+1}, 1, b_{k+1}, 1) (1, 1, 1, a_{k+1})$ and doing some calculations we get the result.

The following lemma allows us to generalize the result to the nonhomogeneous case.

**Lemma 1.** If $x_1$ is arbitrary vector, $b_n$ is 0,1-vector sequence, $a_n$ and $c_n$ are such that $|a_n| = |c_n| = |x_1| \prod_{j=2}^n |b_j|$, $x_n = a_n (b_n \times x_{n-1}) + c_n$ for $n \geq 2$, then

$$x_n = (b_n \times x_1) \prod_{k=2}^n (b_n, k+1 \times a_k) + \sum_{i=2}^n (b_n, i+1 \times c_i) \prod_{k=1+i}^n (b_n, k+1 \times a_k),$$

where $b_{n,k} = b_n \times b_{n-1} \times \cdots \times b_k$, if $k \leq n$ and $b_{n,k} = 1_1$, if $k > n$.

The proof is straightforward.

Vectors $x'_n$ for similar nonhomogeneous sequence $x'_n = a_n x'_{n-1} + b_n x'_{n-2}$ and $c_n$ such that $|x'_n|_{2^n-1}^{|1|} = x'_{n+1}$, are defined as follows: $x'_1 = (x_1, x_2)$, $x'_n = (12 x'_{n-1})(b_n \times 1_{2^n-2}) + c_n (0_{2^n-1} \times 1_1)$ for $n \geq 2$. To use the lemma we should, of course, do substitutions $a_n = h_n \times 1_{2^n-2}$ and $b_{n,k} = 1_{2^n-k-1}$.

**Theorem 3.** If $w_0$ is arbitrary number, $a_{n,j}$ is arbitrary number sequence and $w_n = \sum_{j=0}^{n-1} a_{n,j} w_j$ for $n \in \mathbb{N}$, then

$$\sum_{j=0}^{n} w_j = w_0 \sum_{v \in \nabla_{n}} \prod_{k=1}^{|\mathcal{V}|} a_{(v), k}(0_{1-\mathcal{V}}),$$

where set $\nabla_{n}$ consists of all vectors $v$ such that $1 \leq (v)_{i-1} < (v)_{i} \leq n$ for $2 \leq i \leq |v|$.

**Proof.** Define vectors: $w_0 = (w_0)$, $w_1 = (w_0, a_1 \circ w_0), w_n = w_{n-1} \circ (w_{n-1}, q_n)$ for $n \geq 2$, where $(q_n)_{1} = a_{n,0}$, $(q_{n})_{2^{n-1}+1} = a_{n, k_{2^{n-1}+1}}$ for $1 \leq k \leq n - 1$. From the recurrence equation it follows that if equality $|w_1|_{1} = \sum_{j=0}^{n} w_j$ is true for $l = n - 1 \geq 1$, then it is true for $l = n$; it is true for $l = 1$, so we conclude that it is true for any
l ∈ N. Solving the recurrence equation, we get: \( u_n = w_0 \prod_{k=1}^{n} (1_{2n-k} \times (1_{2k-1} \cdot \omega_k)) \) for \( n \in N \). Noting that \( q_k = \left( a_k, |\log_2 j| \right) \)) we have

\[ |u_n|_1 = w_0 \sum_{j=1}^{2^n} \left( \begin{array}{c} |2^{k-1}, 2^{k-1}| \end{array} \right)_j \left( a_k, |\log_2 (1+i \cdot j \mod 1)| - 1 \right) + 1) \]

The quantity \( |2^{k}, 2^{k}| \) equals the value of kth digit of number \( (j-1) \) in binary numeral system. If \( k_i \) is serial number of ith digit 1, then \( |\log_2 (1+i \cdot j \mod 2^k) \) \( = 1 + k_i \). Therefore, \( |u_n|_1 = w_0 \sum_j \prod_i a_{k_i+1,k_i+1} \), assuming \( k_0 \) = -1. Here \((k_1+1)\) ranges over \( v \in \mathbb{V}_n \): \( k_1 + 1 = (v)_1 \).

In the same way vectors \( u'_n \) for nonhomogeneous sequence \( w'_n = c_n + \sum_{j=0}^{n-1} a_{n,j} \cdot u'_j \) such that \( |u'_i|_1 = \sum_{j=0}^n w_j \) are defined as follows: \( u'_0 = (w_0) \), \( u'_1 = (w_0, c_1 + a_1, 0) \), \( u'_n = u'_{n-1} \cup (w'_{n-1} \cdot u_n) + c_n (0^{2n-1} \cdot 1) \) for \( n \geq 2 \).

### 3. Quadratic map

It is well-known that in many cases iterations of a polynomial of degree 2 in the general case, i.e. solutions of quadratic map, can be expressed by iterations of a polynomial of degree 2 with one parameter.

**Theorem 4.** Let \( p^{(0)}(x) = x \), \( p^{(n)}(x) = p^{(n-1)}(p(x)) \) (for \( n \in N \)) be iterations of polynomial \( p(x) = \lambda(x+1)x \), then

\[ p^{(n)}(x) = \sum_{k=1}^{2^n} x^k \prod_{i=(k-1)\omega_y}^n \lambda^{(i)j-1} \left( \begin{array}{c} i \end{array} \right)_{μ,ij} - 1 \right) \]

where \( ω_y = \left( \frac{2^{m+1}}{2^n} \right) \), \( μ,ij = \left( \frac{\mu,ij}{μ} \right)_{μ,ij} \).

**Proof.** Any polynomial \( p^{(n)}(x) \) can be expressed as follows: \( p^{(n)}(x) = \sum_{k=1}^{2^n} g_n, k \cdot x^k \), where \( g_n, k = g_n, k(λ) \) are polynomials defined by equalities: \( g_{0,1} = 1 \), \( g_{n,k} = \sum_{j=0}^{n-1} q_{k,j} \cdot g_{n-1,j} \) (for \( 0 \leq k \leq n \)), where \( q_{k,j} = \lambda^{(j)k} \).

Let \( p_0 = (1) \), \( p_n = (\lambda \times p_{n-1})(q_n \times 1_{\omega_{n-1}}) \) for \( n \in N \), where

\[ q_n = (q_{1,1})^{2^{n-1}} \times (q_{2,1})^{2^{n-1}} \times \cdots \times (q_{2^{n-1}}, 1) \times 2^{n-1} \]

Then \( ||p_n||_{1+(k-1)\omega_{n-1}} = 1 \) = g_n, k. Solving the equation, we get:

\[ p_n = \prod_{k=1}^{n} \left( \frac{2^{n+k+1}(1-\lambda)}{2^{n-k}} \right) \times q_k \times 1_{\omega_{k-1}} \]

The last step is to check that \( 1 \times q_k \times 1_{\omega_{k-1}} = \left( \frac{q_{μ,j,μ,ij}}{q_{μ,j,μ,ij}} \right)_{j=0}^{∞} \).

**Remark 2.** Using generating polynomial \( |q_k|_1 = \lambda(1 + \lambda)(1 + \lambda^2) - 1 \) / \( (\lambda^m+1 + \lambda^2) - 1 \), where \( m = 2^{k-1} \) and taking in account formula \( |a \times b|_1 = |a|_1 |b|_1 \) we can represent \( p^{(n)}(x) \) as Hadamard’s product of \( n \) functions. The polynomial \( |q_k|_1 \) can be derived using polynomials \( q_{k,m} = \sum_{j=1}^{m} (\lambda^j) - 1 \) as follows. Taking in account that \( q_{k,m} = \lambda(1 + \lambda)^{2m-1} - 1 \) for \( k \geq 3 \) and \( m \geq 1 \), we can write

\[ \lambda^{m+1} \left( q_{k,1} \right)_1 = 1 + \lambda \sum_{k=1}^{2^{m-1}} \sum_{l=1}^{2^{m-1}} \left( \begin{array}{c} \lambda^{m+1} \end{array} \right)_{k,l} + \lambda \left( \begin{array}{c} \lambda^{m+1} \end{array} \right)_{k,l} - 1 \]

From here taking in account \( q_{2m,m} = (\lambda^m) - 1 \) and \( q_{2m-1,m} = (\lambda^m) - 1 \) we immediately get \( |q_k|_1 \).
Let's consider another episode. Let \( s^{(0)}(x) = x, \ s^{(n)}(x) = s^{(n-1)}(s(x)) \) (for \( n \in \mathbb{N} \)) be iterations of polynomial \( s(x) = \lambda x^2 - 1 + 1 \) and \( \lambda \neq 0 \). Define vectors: \( s_1 = (x-1,1) \), \( s_n = \lambda s_{n-1} \), \( \lambda \neq 0 \), where triangular brackets indicate Kronecker degree. Obviously, \(|s_n| = s(|s_{n-1}|) = s^{(n)}(x)\).

Solving the equation, we get:

\[
s_n = \lambda s_{n-1} \colon (\lambda - 1)(2^{n-1} - 1) = \lambda \sum_{i=1}^{n} \lambda_i \rangle \lambda^{-1} - 1 \]

where \( \lambda_n = 1_2^{n-1} \), \( \lambda_{n-1} = \prod_{i=1}^{n} \lambda_i \), \( \lambda^\infty = \prod_{i=1}^{\infty} \lambda_i \).

Therefore, we have

\[
s_{\lambda}^{(n)}(x) = \lambda^{2^{n-1} - 1} \sum_{j=1}^{2^{n-1}} (x-1)^{h_n} \lambda^{-1} \]

where \( h_n = \log_2 (2,1) \). And it can be easily shown that

\[
(h_n)_j = 2^{n-1} - \sum_{k=0}^{\infty} [2^k, 2^k], \text{ and } (\log_2 r_{2,n})_j = \sum_{k,i=0}^{\infty} [2^k(2^i - 1), 2^{k+i}]
\]

by using simple formula

\[
(\log_2 (1_{n-1} \circ (2^n))^\infty)_j = \sum_{k=0}^{n-1} [m^k(m-1), m^k], \text{ (for } j \leq m^n).
\]

Substituting \( 2^{n-1} \) for \( x \) in (2), we have

\[
s_{\lambda}^{(n)}(2) = \lambda^{2^{n-1} - 1} \sum_{k=1}^{2^{n-1}} \kappa_{n,k} \lambda^{-k},
\]

where \( \kappa_{n,k} \) denotes the number of elements in \( \log_2 r_{2,n-1} \) that equal to \( k \). This function can be defined recursively as follows:

\[
\kappa_{n,0} = 3^{2^{n-1}}, \kappa_{n,k} = \delta_{k,1}, \kappa_{n,k} = \delta_{k,2^{n-1}} - \delta_{k,2^{n-2}} + \sum_{i=0}^{k} \kappa_{n-1,k-i} \kappa_{n-1,i}.
\]

Evaluating \( \kappa_{n,k} \) we have:

\[
\kappa_{n,1} = 2^{n-1} 3^{2^{n-1}} - \kappa_{n,2} = 2^{n-1} 3^{2^{n-1}} - \delta_{k,2^{n-2}} + \sum_{k=0}^{n-1} \kappa_{n+1,1}(\kappa_{n+1,2}^{2} + \delta_{k,2^{n-1}} - \delta_{k,2^{n-2}})
\]

and so on.

**Remark 3.** Replacing \( 2^{n-1} \) by \( n \) in the last expression of (1), we get new sequence of vectors: \( s'_{n} = \lambda^{n-1} s_{n}^{(n)}(r_{1}^{2^{n}}) \). Let \( f_n(x) = |s'_n| \). Conjecture:

\[
f_n(x) = \begin{cases} 
  f_{n/2}(s(x)), & \text{if } n \text{ is even} \\
  \lambda f_{n-1}(x), & \text{if } n \text{ is odd} \\
  x, & \text{if } n = 1.
\end{cases}
\]
