Abstract: The effects of shear deformation and rotary inertia on the dynamics of anisotropic plates traversed by varying moving load resting on Vlasov foundation is investigated in this work. The problem is solved for concentrated loads with simply supported boundary conditions. An analytic solution based on the Galerkin’s method is used to reduce the fourth order partial differential equation into a system of coupled fourth order differential equation and a modification of the Struble’s technique and Laplace transforms are used to solve the resulting fourth order differential equation. Results obtained indicate that shear deformation and rotary inertia have significant effect on the dynamics of the anisotropic plate on the Vlasov foundation. Solutions are obtained for both the moving force and the moving mass problems. From the graphical results obtained, the amplitude of vibrations of the plate under moving mass is greater than that of the moving force and increasing the value of rotary inertia $R_0$ reduces the amplitude of vibration of the plate. increasing the mass ratio increases the amplitude of vibration of the plate.

Keywords: Anisotropic plate, shear deformation, rotary inertia, Vlasov foundation, moving force, moving mass.

1. Introduction

Plates are widely used structures with wide engineering applications in aircrafts, nuclear vessels, hydraulics, bridges and roads. There has been a great deal of research on the analysis of structures (shells, plates and beams) with consideration for various factors such as displacements, thickness variation, stresses, curvature, effect of surrounding media, loads and masses. In particular, the problem of moving masses and loads over plates and beams has been a subject of investigation in Mathematics, Physics and Engineering because of its extensive use in everyday life.

Several authors have in particular investigated the effect of shear deformations and rotary inertia on plates and beams including [1,2] with focus on isotropic plates. There has been very little focus on anisotropic plates and in particular the effect of shear deformations and rotary inertia, with varying masses transversing the plates. According to Toorani and Lakis [3], transverse shear deformation plays a very important role in reducing the effective flexural stiffness of anisotropic laminated plates and shells because their in-plane elastic modulus to transverse shear modulus ratio is high. Toorani et al. [3] based on Kirchhoff-Love assumptions opined that shear deformation is more significant in laminated anisotropic plates than isotropic constructions. The researchers, in [1,2,4] worked on the effect of shear deformation and rotary inertia on anisotropic plates with consideration for flexural vibrations, wave amplitude and natural frequencies but not on moving loads. The problem moving loads transversing plates have received little attention unlike the effect of moving loads on isotropic plates and beams have also been studied by authors including [5–7] have given solutions using analytic and approximate methods such as he finite difference, Galerkin, Rayleigh-Ritz, transfer matrix and finite element methods. Kocaturk [8] studied rectangular anisotropic (orthotropic) plates on a tensionless...

The present study modifies the Mindlin plate model which also incorporates both shear deformation and rotary inertia. The study employs varying flexural rigidity and varying mass per unit area in order to make the new model anisotropic.

This study is concerned with the effects of shear deformation and rotary inertia on the dynamics of moving concentrated masses on anisotropic plate resting on Vlasov foundation with simply supported boundary conditions.

2. Problem formulation

The general single equation of a plate which considered the influence of rotary inertia and shear on flexural motions of elastic plates was given by [4]. The elastic Vlasov foundation \( Q(\xi, \eta, \tau) \) from [10,11] is given by:

\[
Q(\xi, \eta, \tau) = (k - G_d \nabla^2) U(\xi, \eta, \tau),
\]

where \( k \) and \( G \) depict the foundation modulus and shear deformation parameter of the elastic Vlasov foundation. Anisotropy of the plate: two mechanical properties of the plate are varying in different directions on the rectangular plate. The flexural rigidity of the plate \( D_d \) given by:

\[
D_d(\xi, \eta) = D_0 \left( 1 - \frac{2x}{a} + \frac{2y^2}{a^2} \right) \left( 1 - \frac{2\eta}{b} + \frac{2\eta^2}{b^2} \right)
\]

and the mass per unit area of the plate \( \mu_d \) given by:

\[
\mu_d(\xi, \eta) = \mu_0 \left( 1 - \frac{2x}{a} + \frac{2y^2}{a^2} \right) \left( 1 - \frac{2\eta}{b} + \frac{2\eta^2}{b^2} \right).
\]

2.1. Governing equation

The equation governing the anisotropic plate is given as:

\[
\left( D_d(\xi, \eta) \nabla^2 - \left( \frac{\mu_d(\xi, \eta)}{hG_d} D_d(\xi, \eta) + R_0 \right) \frac{\partial^2}{\partial \tau^2} \right) \nabla^2 U(\xi, \eta, \tau) + \frac{\partial^2 U(\xi, \eta, \tau)}{\partial \tau^2} \frac{\partial^4 U(\xi, \eta, \tau)}{\partial \tau^4} + (k - G_d \nabla^2) U(\xi, \eta, \tau)
\]

\[
= Mgh\delta(x - v_\xi(t))\delta(y - v_\eta(t)) \left( \frac{1}{8} \left( \frac{\partial^2}{\partial \tau^2} + 2V \frac{\partial}{\partial \tau} + a \right) \left( \frac{\partial}{\partial \xi} + \frac{\partial}{\partial \eta} \right) + \nabla^2 \nabla^2 \right) U(\xi, \eta, \tau),
\]

where \( U(\xi, \eta, \tau) \) is the displacement of the plate \( \xi \) and \( \eta \) are spatial coordinates, \( \tau \) is the time coordinate, \( D_d \) is the variable flexural rigidity of the plate, \( \mu_d \) is the variable mass per unit area of the plate and \( D_0 \) is the constant flexural rigidity of the plate, \( \mu_0 \) is the constant mass per unit area of the plate. \( R_0 \) is the rotary inertia correction factor, \( G_d \) is the shear modulus, \( P(\xi, \eta, \tau) \) is the load, \( M \) is the mass of the load \( v_\xi \) and \( v_\eta \) are the velocity components of the load.

2.2. Dimensionless form

The following dimensionless variables are introduced;

\[
x = \frac{\xi}{a}, \quad y = \frac{\eta}{b}, \quad t = \frac{\tau}{t_0},
\]

where \( t_0 \) will be specified and

\[
\mu = \frac{\mu_d}{\rho h^2}, \quad D = \frac{D_d}{Eh^3}, \quad \kappa = \frac{kh^3}{D}, \quad R_0 = \frac{Mgh^2}{D}, \quad G = \frac{G_d h^3}{D}, \quad V_0 = \frac{Vr}{h}, \quad a_0 = \frac{a\tau^2}{h}.
\]

Substituting Equations (5) and (6) into Equation (4) and making some rearrangements yields:
where as a Fourier series Cosine. In order to solve (7), the displacement written in the form:

plates to a set of coupled fourth order ordinary differential equation. Also the Dirac-Delta function is expressed 

Galerkin’s method to separate variables and reduce the fourth order partial differential equation governing

The initial condition taken as;

3. Method of Solution

The method of analysis involved in solving (7) subject to conditions (10) and (11) requires the use of the 

Galerkin’s method to separate variables and reduce the fourth order partial differential equation governing 

plates to a set of coupled fourth order ordinary differential equation. Also the Dirac-Delta function is expressed 
as a Fourier series Cosine. In order to solve (7), the displacement written in the form:

where $\Lambda_m(x,y)$ are the known eigen-functions of the plate with the same boundary conditions. We obtain the 
value of $\Lambda_m(x,y)$ by considering the free vibration of rectangular plates given by;

where

$\Omega_{nm}, \ m = 1, 2, 3...$ are the natural frequencies of the dynamic system and $y_m(t)$ are amplitude functions which 
have to be solved. $\Lambda_n(x,y)$ are assumed to be products of the function $\phi_{ni}(x)$ and $\phi_{nj}(y)$ which are plate 
functions in the direction of axes respectively. Hence

$$\Lambda_n(x,y) = \phi_{ni}(x)\phi_{nj}(y).$$
Each of these plate functions satisfies all the boundary conditions in its direction respectively. In particular, these plate functions can be defined respectively as:

$$\phi_{ni}(x) = \sin \frac{ni \pi x}{L_x} + A_{ni} \cos \frac{ni \pi x}{L_x} + B_{ni} \sinh \frac{ni \pi x}{L_x} + C_{ni} \cosh \frac{ni \pi x}{L_x}$$

$$\phi_{nj}(y) = \sin \frac{nj \pi y}{L_y} + A_{nj} \cos \frac{nj \pi y}{L_y} + B_{nj} \sinh \frac{nj \pi y}{L_y} + C_{nj} \cosh \frac{nj \pi y}{L_y},$$

where \(A_{ni}, B_{ni}, C_{nj}, A_{nj}\) and \(B_{nj}, C_{nj}\) are constants determined by the boundary conditions. \(\psi_{ni}\) and \(\psi_{nj}\) are called modal frequencies. When the anisotropic plate has arbitrary end support conditions since the plate under consideration has simple support at all its edges, (16) becomes:

$$\phi_{ni}(x) = \sin \frac{n_i \pi x}{L_x}, \quad \phi_{nj}(y) = \sin \frac{n_j \pi y}{L_y}. \quad (17)$$

Therefore the non-dimensional plate function is given as:

$$\phi_{ni}(x) = \sin n_i \pi x, \quad \phi_{nj}(y) = \sin n_j \pi y. \quad (18)$$

### 3.1. Transformation of the governing equation

By applying the Generalized Galerkin’s method Equation (7) is transformed to

$$\sum_{m=1}^{\infty} \left[ \frac{D_1}{\mu_0} (F_x + F_y) \right] \left[ \Lambda_{m,xx}(x,y) y_m(t) + \Lambda_{m,yy}(x,y) y_m(t) \right]$$

$$- \frac{b_1 (F_x F_y)^2}{\mu_0} \left[ \Lambda_{m,xx}(x,y) \ddot{y}_m(t) + \Lambda_{m,yy}(x,y) \ddot{y}_m(t) \right] - \frac{R_0}{\mu_0} \left[ \Lambda_{m,xx}(x,y) \ddot{y}_m(t) + \Lambda_{m,yy}(x,y) \ddot{y}_m(t) \right]$$

$$+ \frac{\mu(x,y) \Lambda_m(x,y) y_m(t)}{\mu_0} \ddot{y}(t) + b_3 F_x F_y \Lambda_m(x,y) y_m(t) + \frac{k_f}{\mu_0} \Lambda_m(x,y) y_m(t)$$

$$- \frac{G_f}{\mu_0} \left[ \Lambda_{m,xx}(x,y) y_m(t) + \Lambda_{m,yy}(x,y) y_m(t) \right] + \frac{P_0}{\mu_0 \delta} \delta(x - v_x t) \delta(y - v_y t) \left( b_3 \Lambda_m(x,y) \dot{y}_m(t) + c_0 \right)$$

$$+ \frac{\nu_0^2}{\mu_0} \left[ \Lambda_{m,xx}(x,y) y_m(t) + \Lambda_{m,yy}(x,y) y_m(t) \right] = \frac{P_0}{\mu_0 \delta} \delta(x - v_x t) \delta(y - v_y t), \quad (19)$$

where

$$\Lambda_{m,xx}(x,y) = \frac{\partial^2}{\partial x^2} \Lambda_m(x,y), \quad \Lambda_{m,yy}(x,y) = \frac{\partial^2}{\partial y^2} \Lambda_m(x,y) \quad (20)$$

Using the property of the Dirac-delta functions and expressing it in the Fourier Cosine series (because it is an even function) as,

$$\delta(x - v_x t) = \frac{1}{L_x} \left( 1 + 2 \sum_{j=1}^{\infty} \cos \frac{j \pi v_x t}{L_x} \cos \frac{j \pi x}{L_x} \right), \quad (21)$$

$$\delta(y - v_y t) = \frac{1}{L_y} \left( 1 + 2 \sum_{k=1}^{\infty} \cos \frac{k \pi v_y t}{L_y} \cos \frac{k \pi y}{L_y} \right). \quad (22)$$

Multiplying both sides of Equation (19) by \(\Lambda_m(x,y)\) in view of the orthogonality of \(\Lambda_m(x,y)\) and integrating on Area (A) of the plate yields, the simplified equation:
\[
\frac{d^4y_p(t)}{dt^4} + a_1^2 \frac{d^2y_p(t)}{dt^2} + a_2^2y_p(t) + e_0 \left[ \left( l_{01}l_{02} + 2 \sum_{j=1}^{\infty} \cos j\pi v_x l_l_{14}l_{02} + 2 \sum_{k=1}^{\infty} \cos k\pi v_y l_l_{14}l_{01} \right) \frac{d^2y_p(t)}{dt^2} + \left( a_1l_{51}l_{02} + b_1l_{01}l_{52} + 2 \sum_{j=1}^{\infty} \cos j\pi v_x l_l_{14}l_{02} + b_1l_{14}l_{01} \right) \frac{dy_p(t)}{dt} \right] + 4 \sum_{j=1}^{\infty} \sum_{k=1}^{\infty} \cos j\pi v_x \cos k\pi v_y l_l_{14}l_{42} \frac{d^2y_p(t)}{dt^2} + \left( a_1l_{51}l_{02} + b_1l_{01}l_{52} + 2 \sum_{j=1}^{\infty} \cos j\pi v_x l_l_{14}l_{02} + b_1l_{14}l_{01} \right) \frac{dy_p(t)}{dt} + 2 \sum_{j=1}^{\infty} \sum_{k=1}^{\infty} \cos k\pi v_y l_l_{14}l_{01} \left( \sum_{j=1}^{\infty} \cos j\pi v_x l_l_{14}l_{02} + b_1l_{14}l_{01} \right) \frac{dy_p(t)}{dt} + 4 \sum_{j=1}^{\infty} \sum_{k=1}^{\infty} \cos j\pi v_x \cos k\pi v_y l_l_{14}l_{42} l_l_{14}l_{02} + 4 \sum_{j=1}^{\infty} \sum_{k=1}^{\infty} \cos j\pi v_x \cos k\pi v_y l_l_{14}l_{42} l_l_{14}l_{02} \right] \times \left[ c_0 \frac{dy_p(t)}{dt} + a_0y_p(t) + \pi_0 \left( (a_1^2 + b_1^2) l_l_{01}l_{02} + 2 \sum_{j=1}^{\infty} (a_j^2 + b_j^2) \cos j\pi v_x l_l_{14}l_{02} \right) \cos j\pi v_x \cos k\pi v_y l_l_{14}l_{42} \right] y_p(t) = \frac{P_0}{\mu_0 D_3 l_l_{211}l_l_{212}} \sin n_j\pi v_x l l_n \sin n_j\pi v_y l l_n,
\]

where

\[
\begin{align*}
B_1 &= D_3 \int_0^1 \int_0^1 l_l_{01} l_l_{02} l_l_{14} l_l_{02} l_l_{14} l_l_{01} l_l_{02} dxdy,
B_2 &= D_4 l_l_{211}l_l_{212} + D_5 (a_j^2 + b_j^2) l_l_{211}l_l_{212} + D_6 (a_j^2 + b_j^2) l_l_{211}l_l_{212},
B_3 &= -D_7 a_j (a_j^2 + b_j^2) l_l_{211}l_l_{212} - D_8 a_j (a_j^2 + b_j^2) l_l_{211}l_l_{212} + D_9 l_l_{01}l_l_{02} - D_6 (a_j^2 + b_j^2) l_l_{01}l_l_{02},
D_3 &= \frac{b_0}{l_l_{14}},
D_4 &= b_3,
D_5 &= \frac{b_5}{l_l_{14}},
D_6 &= \frac{b_6}{l_l_{14}},
D_7 &= \frac{b_7}{l_l_{14}},
D_8 &= \frac{b_8}{l_l_{14}},
D_9 &= \frac{b_9}{l_l_{14}},
\end{align*}
\]

Implementing the integrals above and substituting into Equation (23) yields;

\[
\frac{d^4y_p(t)}{dt^4} + \left( a_1^2 + \frac{c_0}{4} \right) \frac{d^2y_p(t)}{dt^2} + c_0a_1^2 \frac{dy_p(t)}{dt} + \left( a_2^2 + c_0a_2^2 \right) y_p(t) = P_f \sin n_j\pi x \sin n_j\pi y,
\]

where

\[
\Delta_1^2 = \frac{a_1[(p_i + n_i)(-1)^{p_i+n_i} - (p_i - n_i)(-1)^{p_i+n_i} - 2n_i]}{4\pi [p_i^2 - n_i^2]} + \frac{b_1[(-1)^{p_i+n_i} - (p_i - n_i)(-1)^{p_i+n_i} - 2n_i]}{4\pi [p_i^2 - n_i^2]}
\]

\[
\Delta_2^2 = \frac{4n_i \sum_{j=1}^{\infty} \cos j\pi v_x l_l_{14}l_{02} \left( a_1 \frac{2n_i^2 - p_j^2 - n_i^2}{[p_j^2 - (p_i + n_i)^2]} \right) + 4n_i \sum_{k=0}^{\infty} \cos k\pi v_y l_l_{14}l_{01} \left( a_1 \frac{2n_i^2 - p_j^2 - n_i^2}{[k_i^2 - (p_j - n_i)^2]} \right)}{P_f - \frac{P_0 (a_j^2 + b_j^2)}{4\pi [y_{211}l_{212}]}}.
\]
3.2. Case I: Moving force

An approximate model of the differential equation describing the response of anisotropic plates on Vlasov foundation is obtained by neglecting the inertia term \( \epsilon_0 = 0 \). Hence Equation (25) becomes:

\[
\frac{d^4y_p(t)}{dt^4} + \alpha_1^2 \frac{d^2y_p(t)}{dt^2} + \alpha_2^2 y_p(t) = P_f \sin n_1 \pi x \sin n_2 \pi y. \tag{27}
\]

Subjecting (27) to a Laplace transform we us initial boundary conditions (11) yields;

\[
U(x, y, t) = \sum_{n_1=1}^{\infty} \sum_{n_2=1}^{\infty} \frac{1}{w^2_{f1} - w^2_{f2}} \left[ \left( \frac{P_f}{2} \frac{1}{(w^2_{f2} - \omega^2_1)(w^2_{f2} - \omega^2_2)} \left[ (w^2_{f2} - \omega^2_1)(\cos \omega_1 t - \cos \omega_2 t) \right. \right. \\
- \left. \left. (w^2_{f2} - \omega^2_1)(\cos \omega_2 t - \cos \omega_1 t) \right] \frac{1}{(w^2_{f1} - \omega^2_1)(w^2_{f1} - \omega^2_2)} \left[ (w^2_{f1} - \omega^2_1)(\cos \omega_1 t - \cos \omega_1 t) \right. \right. \\
- \left. \left. (w^2_{f1} - \omega^2_1)(\cos \omega_1 t - \cos \omega_1 t) \right] \right) + \left( (\alpha_2^2 - w^2_{f1}) \cos \omega_2 t \right) \left( \alpha_2^2 - \omega^2_1 \right) \sin \frac{n_1 \pi x}{l_x} \sin \frac{n_2 \pi y}{l_y}, \tag{28}
\]

which is the transverse displacement response to a moving varying force by a simply supported anisotropic plate on a Vlasov foundation.

\[
w^2_{f1} = \frac{1}{2} \left[ \alpha_1^2 - \sqrt{\alpha_1^4 - 4\alpha_2^2} \right] \tag{29}
\]

\[
w^2_{f2} = \frac{1}{2} \left[ \alpha_1^2 + \sqrt{\alpha_1^4 - 4\alpha_2^2} \right]
\]

3.3. Case II: Moving mass

We consider the moving mass problem where the inertia term \( \epsilon_0 \) is not neglected. And Equation (25) remains;

\[
\frac{d^4y_p(t)}{dt^4} + \left( \alpha_1^2 + \frac{\epsilon_0}{4} \right) \frac{d^2y_p(t)}{dt^2} + \epsilon_0 \alpha_1^2 \frac{dy_p(t)}{dt} + \left( \alpha_2^2 + \epsilon_0 \alpha_2^2 \right) y_p(t) = P_f \sin n_1 \pi x \sin n_2 \pi y. \tag{30}
\]

To solve (25), we use an approximate analytic solution a modification of the asymptotic method due to Strube’s technique as used by [12–14]. To this end, a modified frequency corresponding to the frequency of the free system due to the presence of the effect of the moving mass is sought by using:

\[
\frac{d^2y_p(t)}{dt^2} + \alpha_{mn}^2 y_p(t) = 0, \tag{31}
\]

where

\[
\alpha_{mn} = \alpha_2 \left[ 1 - \frac{1}{2\alpha_1^4} \left( \frac{\alpha_1^2}{\alpha_2^2} (\alpha_1^2 - 1) + \frac{\epsilon_0}{\alpha_2^2} \left( \Delta_{ij} \alpha_1^2 \right) \right) \right] \tag{32}
\]

\( \alpha_{mn} \) is called the modified natural frequency representing the frequency of the system due to the effect of the foundation. Hence, Equation (30) can be rewritten as:

\[
\frac{d^4y_p(t)}{dt^4} + \frac{d^2y_p(t)}{dt^2} + \alpha_{mn}^2 y_p(t) = P_f \sin n_1 \pi x \sin n_2 \pi y. \tag{33}
\]

Solving (33) using Laplace transforms method subject to initial boundary conditions (11) yields:
\[
U(x, y, t) = \sum_{n_1=1}^{\infty} \sum_{n_2=1}^{\infty} \frac{1}{w_{m1} - w_{m2}} \left( \frac{P}{2} \left( \frac{1}{(w_{m1}^2 - \theta_1^2)(w_{m2}^2 - \theta_1^2)} \right) [w_{m1}^2 - \theta_2^2] (\cos \theta_1 t - \cos w_{m1}t) \right.

\left. - (w_{m2}^2 - \theta_1^2)(\cos \theta_2 t - \cos w_{m2}t)] - \frac{1}{(w_{m1}^2 - \theta_1^2)(w_{m2}^2 - \theta_2^2)} [w_{m2}^2 - \theta_1^2] (\cos \theta_1 t - \cos w_{m1}t) \right)

\left. - (w_{m1}^2 - \theta_1^2)(\cos \theta_2 t - \cos w_{m1}t)] + [(1 - w_{m1}^2) \cos w_{m1}t - (1 - w_{m2}^2) \cos w_{m2}t]y_0 \right) \sin \frac{n_1 \pi x}{l_x} \sin \frac{n_2 \pi y}{l_y},
\]

(34)

which is the transverse displacement response to a moving varying mass by a simply supported anisotropic plate on a Vlasov foundation. Where

\[
w_{m1}^2 = \frac{1}{2} \left[ \alpha_1^2 - \sqrt{1 - 4 \alpha_{mn}^2} \right]

\]

\[
w_{m2}^2 = \frac{1}{2} \left[ \alpha_1^2 + \sqrt{1 - 4 \alpha_{mn}^2} \right]
\]

(35)

### 3.4. Resonance

We consider the resonance which takes place when the displacement of the vibrating structure becomes unbounded. In actual practice, when this happens the structure would collapse as the intensive vibrations causes cracks or permanent deformation in the vibrating system. Therefore, the conditions under which the solutions (28) and (34) grow without bound are investigated. The anisotropic plate traversed by moving force in Equation (28) will reach the state of resonance whenever:

\[
w_{j1} = \theta_1 and \ w_{j2} = \theta_1 \]

\[
w_{j2} = \theta_2 and \ w_{j2} = \theta_2.
\]

(36)

Similarly, Equation (34) shows that the same plate under moving concentrated mass will experience resonance effect whenever:

\[
w_{m1} = \theta_1 and \ w_{m2} = \theta_1 \]

\[
w_{m1} = \theta_2 and \ w_{m2} = \theta_2.
\]

(37)

From Equation (35)

\[
\frac{1}{2} \left[ \alpha_1^2 - \sqrt{1 - 4 \alpha_{mn}^2} \right] - \frac{1}{2} \left[ \alpha_1^2 + \sqrt{1 - 4 \alpha_{mn}^2} \right] = 0.
\]

(38)

Hence

\[
\alpha_{mn} = \pm \frac{1}{2}.
\]

(39)

Similarly from 29

\[
\frac{1}{2} \left[ \alpha_1^2 - \sqrt{1 - 4 \alpha_{mn}^2} \right] - \frac{1}{2} \left[ \alpha_1^2 + \sqrt{1 - 4 \alpha_{mn}^2} \right] = 0.
\]

(40)

Hence

\[
\alpha_1^2 = \pm 2 \alpha_2.
\]

(41)

Now, from Equation (32), we have \(\alpha_{mn} = \alpha_2 \left[ 1 - \frac{1}{2\alpha_1^3} \left( \alpha_1^2 (\alpha_1^2 - 1) + \frac{\alpha_1}{\alpha_2} (\alpha_2^2 - \Delta_i) \right) \right].\) And

\[
\alpha_2 \left( \alpha_2^2 + 2 \alpha_2^2 - \epsilon_0 (\alpha_2 - 2 \Delta_i) \right) < 1.
\]

(42)
From equation above, it is evident that for the same natural frequency, the critical velocity for the system of the plate moving force is greater than that of the moving mass problem. Thus, for the same natural frequency of the anisotropic plate, resonance is reached earlier in the moving mass than in the moving force system.

4. Discussion and Analysis

A rectangular plate of breadth $L_x = 0.456$ and length $L_y = 0.946$ was used as sample to carry out numerical experiments on the dynamics of the anisotropic plate. The velocity of the plate was assumed to be $0.8 \text{m/s}$ and the Young’s modulus $E = 1 \times 10^9 \text{kg/m}^2$.

A comparison of the displacement of structure-load force and structure-load mass system of anisotropic plate on Vlasov foundation is given in Figure 1 showing a larger displacement for the moving mass system. While Figure 2 and Figure 3 show the effects of Rotary inertia ($R_0$) on the anisotropic plate for the moving force and moving mass problems respectively. In both cases, increasing Rotary inertia ($R_0$) reduces the displacement.

Figure 3. Effect of Rotary Inertia on Moving Force

![Figure 3](image3)

Figure 4 shows the effect of mass ratio ($\epsilon_0$) on the anisotropic plate for different values of ($\epsilon_0$), increasing the mass ratio increases the displacement.
Figure 4. Effect of Mass Ratio

Figure 5, Figure 6 and Figure 7 are surface plots of the effect of shear modulus $G$ on the anisotropic plate for $G = 0$, $G = 2000$ and $G = 6000$ respectively. Where $R_0 = 2.4$, $k = 10$, $G_f = 7.7$

Figure 5. Shear Modulus($G$) = 0

Figure 6. Shear Modulus($G$) = 2000

Figure 7. Shear Modulus($G$) = 6000

The effect of rotary inertia ($R_0$) on the dynamics of the anisotropic plate on Vlasov foundation are shown for different values in Figure 8, Figure 9 and Figure 10 when the mass ratio ($e_0 = 0.5$)
Figure 8. Rotary Inertia \((R_0) = 0.01\)

Figure 9. Rotary Inertia \((R_0) = 0.015\)

Figure 10. Rotary Inertia \((R_0) = 0.025\)

Figure 11, Figure 12 and Figure 13 are the surface plots showing the effect of three different mass ratio \((\epsilon_0)\) on the dynamics of the anisotropic plate on Vlasov foundation where \(R_0 = 2.4\), \(f\)requency = 200Hz.
5. Conclusion

The effects of shear deformation and rotary inertia on the dynamics of moving concentrated loads on a rectangular plate with varying flexural rigidity and varying mass per unit area is considered in this study. The plate is resting on a Vlasov foundation. The fourth order partial differential equations which describes the system is reduced to a system of coupled fourth order ordinary differential equations using a method on the separation of variables. A approximate analytic solution to the problem for moving force and moving mass is obtained using a modification of the Struble’s technique and then Laplace transform method. Results obtained from the study indicate that shear deformation, rotary inertia and mass per unit area had significant effect on the dynamics of the anisotropic plate transverse by moving load. The results also indicate that the amplitude of vibrations of the plate under moving mass is greater than that of the moving force for same values of shear modulus and rotary inertia. Results obtained in this study is consistent with results obtained by [6,14–16].
